To the Editor:

I was flabbergasted to read David Brooks's complaint that "the market is failing to supply enough human capital. Despite all the incentives, 30 percent of kids drop out of high school and the college graduation rate has been flat for a generation" ("Reviving the Hamilton Agenda," June 8).

News flash: Nine out of every ten kids in the U.S. in grades K-12 are enrolled in schools owned and operated by the government. It's not the market that's failing. Any

To the Editor:

Steven Landsburg does his usual outstanding job at conveying important economic insights clearly and energetically ("A Brief History of Economic Time," June 9). But he gives us economists too much credit for figuring out "how to harness the power of incentives."

While economists sometimes do devise useful, specific ways to harness incentives (the work of my colleague Vernon Smith comes to mind), most of the good that economists do involves explanation rather than creation. Good economists excel at explaining both how free markets give each of us incentives to contribute to widespread human well-being AND how these incentives are perverted by political institutions (the work of my colleagues James Buchanan and Gordon Tullock comes to mind). Sadly, the history of our discipline is littered with misbegotten schemes to engineer incentives, such as Keynes's nutty proposal to reduce people's incentives to save.
failure here surely is the fault of the very government that Mr. Brooks mysteriously believes should be more active in building human capital.

To the Editor:

Your report "Years of Global Growth Raise Inflation Worries" (June 6) is confused and confusing. It's incorrect to say that "global growth is fueling inflation rather than restraining it." Inflation - as the old saw goes - is caused by too much money chasing too few goods. Because economic growth creates more goods, such growth moves the price level downward. If economies are growing and also experiencing inflation, you can be darn sure that central banks are pumping out money too fast.

To the Editor:

It's inspiring to read Linda Chavez's report on how well Hispanics assimilate into America's society and economy ("The Great Assimilation Machine," June 5). This achievement is especially remarkable given that the employment in America of several million Hispanics - the...
"illegals" - is formally prohibited. Imagine how much higher still their earnings and their rates of employment, homeownership, and education would be if no employer had to fear prosecution for the "crime" of hiring any willing worker.

4 June 2007

Editor, USA Today

To the Editor:

Dale Powers argues that the hiring of foreign skilled workers "wastes" the brainpower of Americans ("Don't waste U.S. brainpower by hiring foreign workers for coveted jobs," June 4). Mr. Powers' brainpower as an aerospace engineer might be awesome, but it's weak in economics.

The number and kinds of jobs in a market economy aren't fixed. They expand and change as entrepreneurs seek to use all available talent as productively as possible. Consider the microchip - which, after all, is a substitute for lots of human brainpower. If Mr. Powers' argument were correct, the advent of this device would have cast millions of smart, educated Americans into low-skilled jobs. Instead, of course, the microchip has created for talented Americans countless high-wage jobs whose existence was inconceivable thirty years ago.
